32-bit ARM<sup>®</sup> Cortex<sup>®</sup>-M0+ Microcontroller

**Puya Semiconductor (Shanghai) Co., Ltd**

## Features

- Core
  - ARM® 32-bit Cortex®-M0+ CPU
  - Up to 72 MHz operating frequency
- Memories
  - Maximum 128 Kbytes Flash memory
  - Maximum 16 Kbytes SRAM
- Clock management
  - Internal 4/8/16/22.12/24 MHz high speed clock (HSI)
  - Internal 32.768 kHz low speed clock (LSI)
  - External 4 to 32 MHz high speed crystal oscillator (HSE)
  - External 32.768 kHz low-speed crystal oscillator (LSE)
  - PLL (supports 2/3 multiplication of HSE)
- Power management and reset
  - Operating voltage: 1.7 to 5.5 V
  - Low power modes: Sleep and Stop
  - Power-on/power-down reset (POR/PDR)
  - Brown-out reset (BOR)
  - Programmable voltage detection (PVD)
- General-purpose input and output (I/O)
  - Up to 58 I/Os, all available as external interrupts
  - Drive current 8 mA
- 7-channel DMA controller
- One 12-bit ADC
  - Up to 16 external input channels
  - Input voltage conversion range: 0 to  $V_{CCA}$
- 2 analog comparators
- 2-channel operational amplifier
- Support 8 \* 36 / 4 \* 40 LCD
- 13 timers
  - One 16-bit advanced-control timer (TIM1)
  - One 32-bit general-purpose timer (TIM2)
  - Five 16-bit general-purpose timers (TIM3/14/15/16/17)
  - Two basic timers (TIM6/TIM7)
  - A low power timer (LPTIM)
  - An independent watchdog timer (IWDT)
  - A window watchdog timer (WWDT)
  - A SysTick timer
- RTC
- Communication interfaces
  - Two serial peripheral interfaces (SPI) with I<sup>2</sup>S function
  - Four universal synchronous/asynchronous Transceivers (USARTs), support automatic baud rate detection, two of USARTs support ISO7816, LIN and IrDA
  - Two I<sup>2</sup>C interfaces supporting standard mode (100 KHz), Fast mode (400 KHz), 7-bit/10-bit addressing mode and SMBus
- Hardware CRC-32 module
- Hardware 32-bit divider
- Unique UID
- Serial wire debug (SWD)
- Operating temp.: - 40 ~ 85 °C, - 40 ~ 105 °C
- Package: LQFP64(12\*12), LQFP64(10\*10), LQFP48, QFN32(5\*5), QFN32(4\*4), QFN48

# 1. Introduction

PY32F040 series microcontrollers incorporate high-performance ARM® 32-bit Cortex®-M0+ core, wide operating range voltage, embedded memories with up to 128 Kbytes flash and 32 Kbytes SRAM, frequency up to 72 MHz, and contains various products in different package types. The chip integrates multi-channel I<sup>2</sup>C, SPI, USART and other communication peripherals, one 12-bit ADC, 13 timers, two comparators, two operational amplifiers, and one LCD driver.

PY32F040 series microcontrollers 's operate in the temperature range from -40 to 85 °C or -40 to 105 °C ,and with operating voltages from 1.7 to 5.5 V. The chip provides sleep and stop low-power operating modes, which can meet different low-power applications.

The devices are suitable for various application scenarios, such as controllers, portable devices, PC peripherals, gaming and GPS platforms, industrial applications.

## 2. Functional Overview

### 2.1. Arm®-Cortex®-M0+ core

The Arm® Cortex®-M0+ is an entry-level Arm 32-bit Cortex processor designed for a wide range of embedded applications. It provides developers with significant benefits, including:

- Simple structure, easy to learn and program
- Ultra-low power consumption, energy-saving operation
- Reduced code density and more

Cortex-M0+ processor is a 32-bit core optimized for area and power consumption and is a 2-stage pipeline Von Neumann architecture. The processor offers high-end processing hardware, including single-cycle multipliers, through a streamlined but powerful instruction set and an extensively optimized design. Moreover, it delivers the superior performance expected from a 32-bit architecture computer, with a higher coding density than other 8 and 16-bit microcontrollers.

The Cortex-M0+ is tightly coupled with a Nested Vectored Interrupt Controller (NVIC).

### 2.2. Memories

The on-chip integrated SRAM is accessed by bytes (8 bits), half-word (16 bits) or word (32 bits).

The on-chip integrated Flash consists of two different physical areas:

- Main flash area contains application and user data
- Information area has 14 Kbytes, and it includes the following parts:
  - Option bytes
  - UID bytes
  - System memory

The protection of Flash main memory includes the following mechanisms:

- Read protection (RDP) prevents outside access.
- Write protection (WRP) prevents unwanted write operation (confuse by program memory pointer from PC). The minimum protection unit for write protection is 8 Kbytes.
- Option byte write protection is a special design for unlock.

## 2.3. Boot modes

At startup, the BOOT0 pin and boot selector option bit nBOOT are used to select one of the three boot options in the following table:

Table 2-1 Boot configuration

Boot mode configuration		Mode
nBOOT1 bit	BOOT0 pin	
X	0	Main Flash as the boot area
1	1	System memory as the boot area
0	1	SRAM as the boot area

The Boot loader is located in the System memory and is used to download the Flash program through the USART interface.

## 2.4. Clock system

At startup, the default system clock frequency is HSI 8 MHz, and after the program is operating the system clock frequency and system clock source can be reconfigured. The high frequency clocks that can be selected are:

- A 4/8/16/22.12/24 MHz configurable internal high precision HSI clock
- A 32.768 kHz configurable internal LSI clock
- A 4 to 32 MHz HSE clock, and used to enable the CSS function to detect HSE. If CSS fails, the hardware will automatically convert the system clock to HSI, and software configures the HSI frequency. Simultaneously, CPU NMI interrupt is generated.
- A 32.768 kHz LSE clock.
- PLL clock has HSI and HSE sources. If the HSE source is selected, when CSS is enabled and CSS fails, the PLL and HSE will be turned off, and the hardware selects the system clock source as HSI.

The AHB clock can be divided based on the system clock, and the APB clock can be divided based on the AHB clock. AHB and APB clock frequencies up to 72 MHz.

## 2.5. Power management

### 2.5.1. Power block diagram

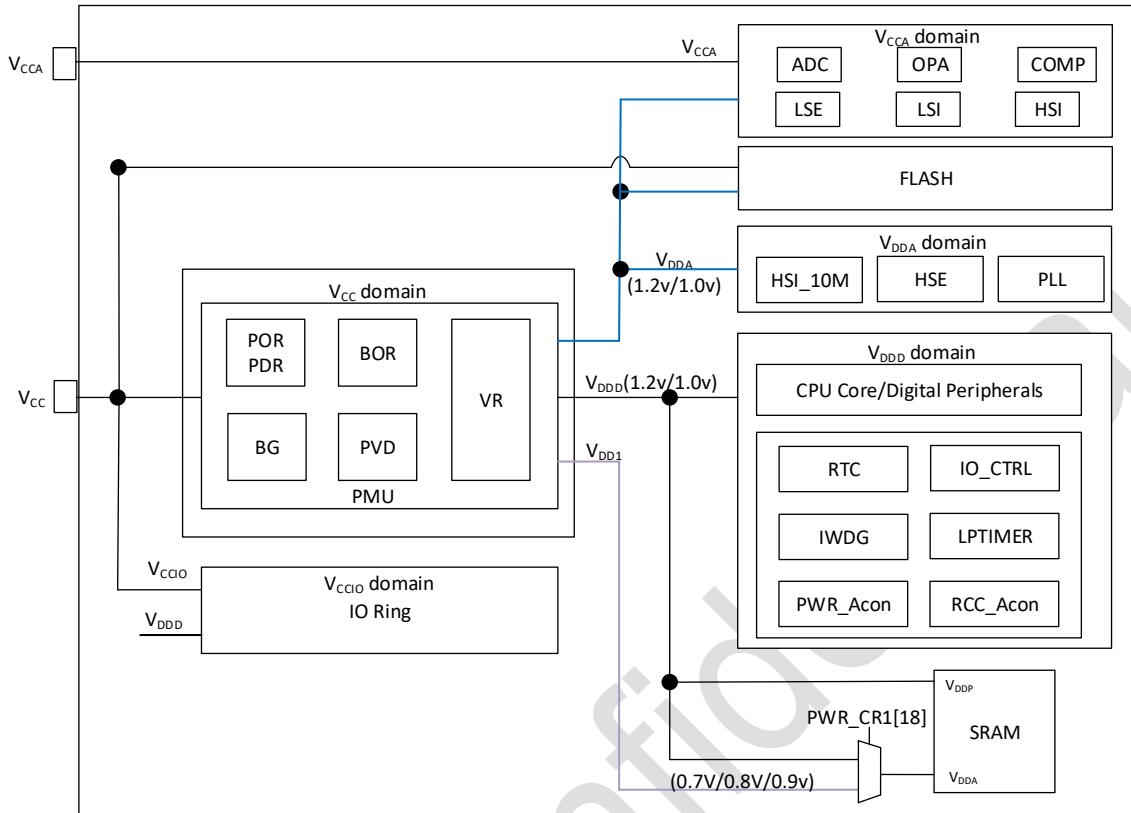

Figure 2-2 Power block diagram

Table 2-2 Power Block Diagram

No.	Power supply	Power value	Describe
1	V <sub>CC</sub>	1.7 to 5.5 V	The chip is supplied power through the power pins.
2	V <sub>DDD</sub>	1.2/1.0 V ± 10 %	VR supplies power to the main logic circuits and SRAM inside the chip. When the MR is powered, it outputs 1.2 V. According to the software configuration, when entering the stop mode it is powered by MR or LPR, and the LPR output is determined to be 1.2 V or 1.0 V.
3	V <sub>CCA</sub>	1.7 to 5.5 V	The chip is supplied analog power through the power pins.

### 2.5.2. Power monitoring

#### 2.5.2.1. Power on reset (POR/PDR)

The power-on reset (POR) and power-down reset (PDR) module is designed in the chip to provide power-on and power-off reset for the chip. The module keeps working in all modes.

#### 2.5.2.2. Brown-out reset (BOR)

In addition to POR/ PDR, BOR (brown-out reset) is also implemented. BOR can only be enabled and disabled through the option byte.

When the BOR is turned on, the BOR threshold can be selected by the Option byte, and both the rising and falling detection points can be configured individually.

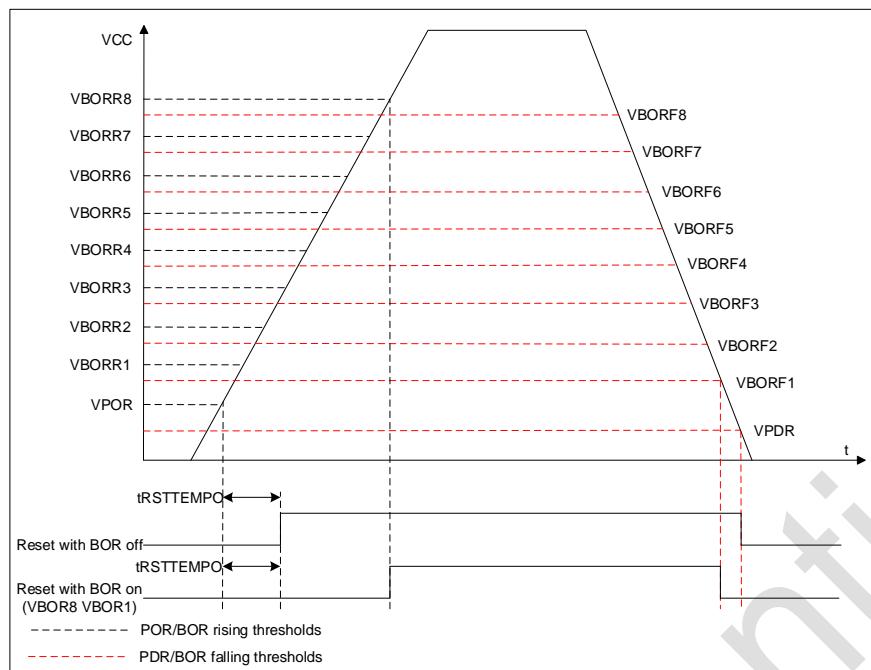

Figure 2-3 POR/PDR/BOR threshold

#### 2.5.2.3. Programmable voltage detection (PVD)

Programmable voltage detector (PVD) module can be used to detect the V<sub>CC</sub> power supply and the voltage of the PB7 pin, and the detection point is configured through the register. When V<sub>CC</sub> is higher or lower than the detection point of PVD, the corresponding reset flag is generated.

This event is internally connected to line 16 of EXTI, depending on the rising/falling edge configuration of EXTI line 16, when V<sub>CC</sub> rises above the detection point of PVD, or V<sub>CC</sub> falls below the detection point of PVD, an interrupt is generated. In the service program, users can perform urgent shutdown tasks.

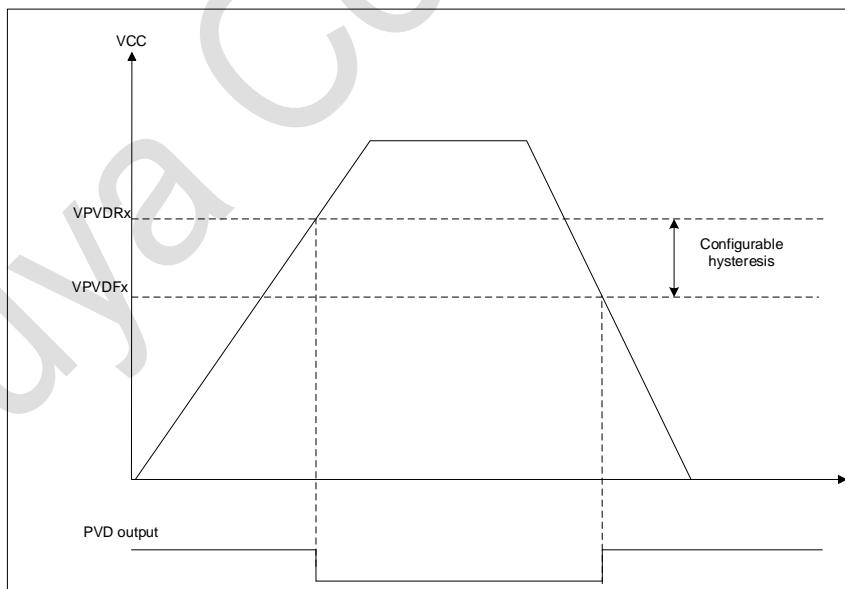

Figure 2-4 PVD threshold

#### 2.5.3. Voltage regulator

The regulator has two operating modes:

- Main regulator (MR) is used in normal operating mode.
- Low power regulator (LPR) can be used in Stop mode where the power demand is reduced.

#### 2.5.4. Low-power mode

In addition to the normal operating mode, the chip has 2 low-power modes:

- Sleep mode: Peripherals can be configured to keep working when the CPU clock is off (NVIC, SysTick, etc.). It is recommended only to enable the modules that must work, and close the module after the module works.
- Stop mode: In this mode, the contents of SRAM and registers are maintained, HSI and HSE are turned off, and most modules of clocks in the V<sub>DD</sub> domain are stopped. GPIO, PVD, COMP output, RTC and LPTIM can wake up stop mode.

## 2.6. Reset

Two resets are designed in the chip: power reset and system reset.

### 2.6.1. Power reset

A power reset occurs in the following situations:

- Power-on/power-down reset (POR/PDR)
- Brown-out Reset (BOR)

### 2.6.2. System reset

A system reset occurs when the following events occur:

- Reset of NRST pin
- Windowed watchdog reset (WWDG)
- Independent watchdog reset (IWDG)
- SYSRESETREQ software reset
- Option byte load reset (OBL)

## 2.7. General-purpose inputs and outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function, locking mechanism will freeze I/Os configuration function.

- Register support IO Port / AHB bus read/write
- Output state: push-pull or open-drain output + pull-up/pull-down
- Data output from data register (GPIOx\_ODR) or peripheral (multiplexed function output)
- Speed selectable per I/O
- Input states: float, pull-up/pull-down, analogue
- Data input to input data register (GPIOx\_IDR) or peripheral (multiplexed function input)
- Bit position/reset register (GPIOx\_BSRR), allows bit write access to GPIOx\_ODR
- Lockout mechanism (GPIOx\_LCKR) freezes I/O port configuration functions
- Analogue function
- Multiplexing function selection register (up to 16 multiplexing functions per IO port)
- Fast flip-flop capability in a single cycle
- Highly flexible I/O multiplexing function, allowing the I/O port to function as a GPIO or as an interface to various peripherals

## 2.8. Hardware divider (DIV)

Hardware divider is a 32-bit signed/unsigned integer hardware divider.

DIV features:

- Configurable signed/unsigned integer division calculation
- 32-bit dividend, 32-bit divisor
- Output 32-bit quotient and 32-bit remainder
- Division zero warning flag, division end flag
- 8 clock cycles to complete a division operation
- Write the divisor register to trigger the division operation to start
- Automatically wait for the end of the calculation when reading the quotient register/remainder register

## 2.9. Direct memory access controller (DMA)

Direct memory access (DMA) is used to provide high-speed data transfer between peripherals and memory or between memory and memory. Data can be moved quickly through DMA without CPU intervention, which saves CPU resources for other operations. The DMA controller has seven channels, each dedicated to managing requests for memory access from one or more peripherals. There is also a mediator to coordinate the priority of individual DMA requests.

The main functions are as follows:

- Single AHB master
- Support peripherals to memory, the memory to the peripherals, memory to memory and peripherals to peripheral data transmission
- On-chip memory devices, such as FLASH, an SRAM, AHB and APB peripherals, as the source and target
- All DMA channel can be independent configuration:
  - Each channel is associated either with a DMA request signal from a peripheral or with a software trigger in a memory-to-memory transfer. This configuration is done by software.
  - The priority between requests is programmable by software (4 levels per channel: very high, high, medium, low) and, in equal cases, by hardware (such as a request for channel 1 taking precedence over a request for channel 2).
  - The transfer sizes of the source and destination are independent (byte, half word, word), simulating packing and unpacking. The source and destination addresses must be aligned by data size.
  - Programmable data transmission: 0 ~ 65535
- Each channel generates an interrupt request. Each interrupt request is caused by one of three DMA events: transfer completion, half-transfer, or transfer error.

## 2.10. Interrupts

The PY32F040 handles exceptions through the Cortex-M0+ processor's embedded a nested vectored interrupt controller (NVIC) and an extended interrupt/event controller (EXTI).

### 2.10.1. Nested vectored interrupt controller (NVIC)

NVIC is a tightly coupled IP inside the Cortex-M0+ processor. The NVIC can handle NMI (Non-Maskable Interrupts) and maskable external interrupts from outside the processor and Cortex-M0+ internal exceptions. NVIC provides flexible priority management.

The tight coupling of the processor core to the NVIC greatly reduces the delay between an interrupt event and the initiation of the corresponding interrupt service routine (ISR). The ISR vectors are listed in a vector table, stored at a base address of the NVIC. The vector table base address determines the vector address of the ISR to execute, and the ISR is used as the offset composed of serial numbers.

If a high-priority interrupt event occurs and a low-priority interrupt event is just waiting to be serviced, the later-arriving high-priority interrupt event will be serviced first. Another optimization is called tail-chaining. When returning from a high-priority ISR and then starting a pending low-priority ISR, unnecessary pushes and pops of processor contexts will be skipped. This reduces latency and improves power efficiency.

NVIC features:

- Low latency interrupt handling
- Level 4 interrupt priority
- Supports one NMI interrupt
- Support 32 maskable external interrupts
- High-priority interrupts can interrupt low-priority interrupt responses
- Support tail-chaining optimization
- Hardware interrupt vector retrieval

### 2.10.2. Extended interrupt/event controller (EXTI)

EXTI adds flexibility to handle physical wire events and generates wake-up events when the processor wakes up from stop mode.

The EXTI controller has multiple channels, including a maximum of 16 GPIOs, 1 PVD output, 2 COMP outputs, RTC and LPTIM wake-up signals. GPIO, PVD and COMP can be configured to be triggered

by a rising edge, falling edge or double edge. Any GPIO signal can be configured as EXTI0 to 15 channel through the select signal.

- Each EXTI line can be independently masked through registers.
- The EXTI controller can capture pulses shorter than the internal clock period.
- Registers in the EXTI controller latch each event. Even in stop mode, after the processor wakes up from stop mode, it can identify the wake-up source or identify the GPIO and event that caused the interrupt.

## 2.11. Analog-to-digital converter (ADC)

The chip has a 12-bit SARADC. The module has up to 21 channels to be measured, including 16 external channels and 5 internal channels. The reference voltage can be selected from the supply voltage.

- The conversion mode of each channel can be set to single, continuous, sweep, discontinuous mode. Conversion results are stored in left or right-aligned 16-bit data registers.
- An analogue watchdog allows the application to detect if the input voltage exceeds a user-defined high or low threshold.
- The ADC has been implemented to operate at a low frequency, resulting in lower power consumption.
- At the end of sampling, conversion, and continuous conversion, an interrupt request is generated when the conversion voltage exceeds the threshold when simulating the watchdog.

## 2.12. Comparators (COMP)

Three general purpose comparators are integrated in the chip, namely COMP1/2. It can be used as a separate module or in combination with timer.

Comparators can be used as follows:

- Triggered by analog signal to generate low-power mode wake-up function
- Analog signal conditioning
- Cycle by cycle current control loop when connected with PWM output from timer

## 2.13. Operational amplifier (OPA)

The OPA1/2 module can be flexibly configured and is suitable for simple amplifiers. The three internal opamps can be cascaded using external resistors.

OPA features are summarized as follows:

- Three independently configured operational amps
- OPA input range is 0 to AVcc, output range is 0.1 V to AVcc - 0.2 V (demand) to simulate a module, a programmable gain
- Can be configured for the following models
  - General operational mode (general purpose OPA)

## 2.14. Liquid crystal display (LCD) controller

The LCD controller is a digital controller/driver for monochrome passive liquid crystal displays (LCDS), with up to 8 common terminals (COM) and 40 segment terminals (SEG) to drive 160 (4 \* 40) or 288 (8 \* 36) LCD image elements. The exact number of terminals depends on the device pins described in the data manual. LCD functions are summarized as follows:

- Highly flexible frame rate control
- support static, 1/2, 1/3, 1/4, 1/6, and 1/8 of a duty ratio
- support 1/2, 1/3 bias voltage
- up to 16 registers LCD data RAM
- by software configuration of LCD contrast
- 3 kinds of waveform generation
  - internal resistance pressure resistance, external pressure, external capacitance partial pressure
  - by way of internal resistance of the software configuration partial pressure power consumption, so as to match the capacitance charge needed for the LCD panel

- support low power consumption modes: LCD controller can be on the run, Sleep and stop mode for display
- configurable frame interrupt
- support LCD flashing function and configuration of multiple flicker frequency
- unused LCD segments and public pin can be configured to digital or analog functions

## 2.15. Timer

The characteristics of different timers of PY32F040 series are shown in the following table:

Table 2-3 Timer features comparison

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA	Capture /compare channels	Complementary outputs
Advanced control	TIM1	16-bit	Up, down, center aligned	Integer from 1 to 65536	Support	4	3
General purpose	TIM2	32-bit	Up, down, center aligned	Integer from 1 to 65536	Support	4	-
General purpose	TIM3	16-bit	Up, down, center aligned	Integer from 1 to 65536	Support	4	-
	TIM14	16-bit	Up	Integer from 1 to 65536	-	1	-
	TIM15	16-bit	Up	Integer from 1 to 65536	-	2	1
	TIM16, TIM17	16-bit	Up	Integer from 1 to 65536	Support	1	1
Basic	TIM6, TIM7	16-bit	Up	Integer from 1 to 65536	Support	-	-

### 2.15.1. Advanced-control timer (TIM1)

The advanced-control timer (TIM1) is consist of a 16-bit auto-reload counter driven by a programmable prescaler. It can be used in various scenarios, including pulse length measurement of input signals (input capture) or generating output waveforms (output compare, output PWM, complementary PWM with dead-time insertion).

TIM1 includes 4 independent channels:

- Input capture
- Output comparison
- PWM generation (edge or center-aligned mode)
- Single pulse mode output

If TIM1 is configured as a standard 16-bit timer, it has the same features as the TIMx timer. If configured as the 16-bit PWM generator, it has full modulation capability (0-100%).

The counter can be frozen in debug mode.

Many features are shared with those of the standard timers which have the same architecture. The advanced control timer can therefore work together with the other timers by the Timer Link feature for synchronization or event chaining.

TIM1 supports the DMA function.

### 2.15.2. General-purpose timers

#### 2.15.2.1. TIM2/TIM3

The general-purpose timers TIM2/TIM3 are consist of 32/16-bit auto-reload counters and a 32/16-bit prescaler. There are four independent channels each for input capture/output compare, PWM or one-pulse mode output.

- They can work with the TIM1 by the Timer Link.
- TIM2/TIM3 supports DMA function.
- This timer is capable of handling quadrature (incremental) encoder signals and the digital outputs from 1 to 3 hall-effect sensors.

- The counter can be frozen in debug mode.

#### 2.15.2.2. TIM14

- The general-purpose timer (TIM14) is consist of a 16-bit auto-reload counter driven by a programmable prescaler.
- TIM14 features one single channel for input capture/output compare, PWM or one-pulse mode output.
- The counter can be frozen in debug mode.

#### 2.15.2.3. TIM15/TIM16/TIM17

- The general-purpose timer (TIM15, TIM16 and TIM17) is consist of a 16-bit auto-reload counter driven by a programmable prescaler.
- TIM16/TIM17 features one single channel for input capture/output compare, PWM or one-pulse mode output.
- TIM15 features two single channel for input capture/output compare, PWM or one-pulse mode output.
- TIM15/TIM16/TIM17 have complementary outputs with dead time.
- TIM15/TIM16/TIM17 supports DMA function.
- The counter can be frozen in debug mode.

#### 2.15.3. Basic timers (TIM6/TIM7)

- The basic timer (TIM6/TIM7) is consist of a 16-bit auto-reload upcounter driven by their programmable prescaler respectively.
- Generate interrupt/DMA request on update event (counter overflow).

#### 2.15.4. Low power timer (LPTIM)

- LPTIM is a 16-bit upcounter with a 3-bit prescaler and only support a single count.
- LPTIM can be configured as a stop mode wake-up source.
- The counter can be frozen in debug mode.

#### 2.15.5. Independent watchdog (IWDG)

Independent watchdog (IWDG) is integrated in the chip, and this module has the characteristics of high-security level, accurate timing and flexible use. IWDG finds and resolves functional confusion due to software failure and triggers a system reset when the counter reaches the specified timeout value.

- The IWDG is clocked by LSI, so even if the main clock fails, it can keep working.
- IWDG is the best suited for applications that require the watchdog as a standalone process outside of the main application and do not have high timing accuracy constraints.
- Controlling of option byte can enable IWDG hardware mode.
- IWDG is the wake-up source of stop mode, which wakes up stop mode by reset.
- The counter can be frozen in debug mode.

#### 2.15.6. System window watchdog (WWDG)

The system window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the APB clock (PCLK). It has an early warning interrupt capability, and the counter can be frozen in debug mode.

#### 2.15.7. SysTick timer

SysTick timer is dedicated to real-time operating systems, but could also be used as a standard downcounter.

SysTick Features:

- 24-bit down counter
- Auto-reload capability
- Maskable system interrupt generation when the counter reaches 0

## 2.16. Real-time clock (RTC)

The real-time clock is an independent counter. It has a set of continuous counting counters, which can provide a clock calendar function under the corresponding software configuration. Modifying the value of the counter can reset the current time and date of the system.

- RTC is a 32-bit programmable counter with a prescale factor of up to  $2^{20}$  bits.
- The RTC counter clock source can be LSE/LSI and the stop wake-up source.
- RTC can generate alarm interrupt, second interrupt and overflow interrupt (maskable).
- RTC supports clock calibration.
- RTC can be frozen in debug mode.

## 2.17. Cyclic redundancy check cell(CRC)

CRC computing unit is based on a fixed generation polynomial to obtain 32-bit CRC computing results. In other applications, CRC technology is mainly used to verify the correctness and integrity of data transmission or data storage. CRC cell contains one 32-bit data register:

- When writing to this register, as an input register, you can enter new data to perform CRC calculations.
- When the register is read, the result of the last CRC calculation is returned.
- Each time a data register is written, the result of the calculation is a combination of the previous CRC calculation and the new calculation (CRC calculation is performed on the entire 32-bit word rather than byte by byte).
- You can RESET register CRC\_DR to 0xFFFF by setting the reset bit of register CRC\_CR. This operation does not affect the data in register CRC\_IDR.
- The initial CRC value can be configured.

## 2.18. System configuration controller (SYSCFG)

The SYSCFG module provides the following functions:

- The filtering function on the IO pin of the \_I<sup>2</sup>C type was enabled or disabled
- Enable or disable filtering on all I/O pins
- Remap trigger sources for some Dmas to different DMA channels
- Remap memory at the beginning of the code interval (Boot)
- Manages the TIMERS ETR or brake input

## 2.19. Debug support (DBG)

The MCU DBG module assists the debugger with the following functions:

- Support sleep mode, stop mode and standby mode
- When the CPU enters the HALT mode, the control timer or watchdog stops counting or continues counting
- Block I<sup>2</sup>C1 and I<sup>2</sup>C2 SMBUS timeouts when the CPU is in HALT mode
- Assign tracking pins
- The MCUDBG register also provides chip ID encoding. This ID encoding can be accessed by a JTAG or SW debug interface, or by a user program.

## 2.20. Inter-integrated circuit interface (I<sup>2</sup>C)

I<sup>2</sup>C (inter-integrated circuit) bus interface connects the microcontroller and the serial I<sup>2</sup>C bus. It provides multi-master capability and controls all I<sup>2</sup>C bus specific sequences, protocols, arbitration and timing. Standard mode (Sm) and fast mode (Fm) are supported.

I<sup>2</sup>C Features:

- Two I<sup>2</sup>C Interface, support slave and master mode
- Multi-host function: can be master or slave
- Support different communication speeds
  - Standard Mode (Sm): Up to 100 KHz
  - Fast Mode (Fm): up to 400 KHz
- As master

- Generate Clock
- Generation of Start and Stop
- As slave
  - Programmable I<sup>2</sup>C address detection
  - Dual-address capability that responds to two secondary addresses
  - Discovery of the Stop bit
- 7-bit/10-bit addressing mode
- General call
- Status flag
  - Transmit/receive mode flags
  - Byte transfer complete flag
  - I<sup>2</sup>C busy flag bit
- Error flag
  - Master arbitration loss
  - ACK failure after address/data transfer
  - Start/Stop error
  - Overrun/Underrun (clock stretching function disable)
- Optional clock stretching
- Single-byte buffer with DMA capability
- Software reset
- Analog noise filter function
- Support SMBus

## 2.21. Universal synchronous/asynchronous receiver transmitter (USART)

PY32F040 contains 4 USARTs, supports ISO7816, LIN, IrDA.

The USARTs provide a flexible method for full-duplex data exchange with external devices using the industry-standard NRZ asynchronous serial data format. The USART utilizes a fractional baudrate generator to provide a wide range of baudrate options.

It supports simultaneous one-way communication and half-duplex single-wire communication, and it also allows multi-processor communication.

Automatic baudrate detection is supported.

High-speed data communication can be achieved by using the DMA method of the multi-buffer configuration.

USARTs features:

- Full-duplex asynchronous communication
- NRZ standard format
- Configurable 16 times or 8 times oversampling for increased flexibility in speed and clock tolerance
- Programmable baudrate shared by transmit and receive, up to 4.5 Mbit/s
- Automatic baudrate detection
- Programmable data length of 8 or 9 bits
- Configurable stop bits (0.5, 1, 1.5 or 2 bits)
- Synchronous mode and clock output function for synchronous communication
- Single-wire half-duplex communication
- Independent transmit and receive enable bits
- Hardware flow control
- Receive/transmit bytes by DMA buffer
- Detection flag
  - Receive full buffer
  - Send empty buffer
  - End of transmission
- Parity control
  - Send check digit
  - Check the received data
- Flagged interrupt sources
  - CTS change
  - Send empty register
  - Send completed

- Receive full data register
- Bus idle detected
- Overflow error
- Frame error
- Noise operation
- Error detection
- Multiprocessor communication
  - If the address does not match, enter silent mode
- Wake-up from silent mode: by idle detection and address flag detection

## 2.22. Serial peripheral interface (SPI)

PY32F040 contains two SPIs. SPIs allow the chip to communicate with external devices in half-duplex, full-duplex, and simplex synchronous serial communication. This interface can be configured in master mode and provides the communication clock (SCK) for external slave devices. The interface can also work in a multi-master configuration.

The SPI features are as follows:

- Master or slave mode
- 3-wire full-duplex simultaneous transmission
- 2-wire half-duplex synchronous transmission (with bidirectional data line)
- 2-wire simplex synchronous transmission (no bidirectional data line)
- 8-bit or 16-bit transmission frame selection
- Support multi-master mode
- 8 master mode baud rate prescale factors (max  $f_{PCLK}/2$ )
- Slave mode frequency (max  $f_{PCLK}/4$ )
- Both master and slave modes can be managed by software or hardware NSS: dynamic change of master/slave operating mode
- Programmable clock polarity and phase
- Programmable data order, MSB first or LSB first
- Dedicated transmit and receive flags that can trigger interrupts
- SPI bus busy status flag
- Motorola mode
- Interrupt-causing master mode faults, overloads
- Two 32-bit Rx and Tx FIFOs with DMA capability

## 2.23. Serial wire debug (SWD)

The ARM SWD interface allows serial debugging tools to be connected to the PY32F040.

1. Configure by option bytes to choose PF2 or NRST.

- 
2. After reset, PA13 and PA14 are configured as SWDIO and SWCLK AF functions, the former has an internal pull-up resistor and the latter has an internal pull-down resistor activated.
  3. BOOT0 defaults to digital input mode and pull-down is enable.

## 5. Electrical Characteristics

### 5.1. Parameter conditions

Unless otherwise specified, all voltages are referenced to V<sub>SS</sub>.

#### 5.1.1. Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at T<sub>A</sub> = 25°C and T<sub>A</sub> = T<sub>A(max)</sub> (given by the selected temperature range).

Data based on electrical characterization results, design simulations and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation.

#### 5.1.2. Typical values

Unless otherwise specified, typical data is based on T<sub>A</sub> = 25°C and V<sub>CC</sub> = 3.3V. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than equal to the value indicated.

### 5.2. Absolute maximum ratings

Stresses above the absolute maximum ratings listed in following tables may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 5-1 Voltage characteristics <sup>(1)</sup>

Symbol	Ratings	Minimum	Maximum	Unit
V <sub>CC</sub>	External mains power supply	-0.3	6.25	V
V <sub>IN</sub>	Input voltage of other pins	-0.3	V <sub>CC</sub> + 0.3	V

1. Power supply V<sub>CC</sub> and ground V<sub>SS</sub> pins must always be connected to the external power supply within the allowable range.

Table 5-2 Current characteristics

Symbol	Describe	Maximum	Unit
I <sub>VCC</sub>	Flowing into V <sub>CC</sub> pin (supply current) <sup>(1)</sup>	300	mA
I <sub>VSS</sub>	Total current flowing out of V <sub>SS</sub> pin (outflow current) <sup>(1)</sup>	300	
I <sub>IO(PIN)</sub>	Output sink current of COM IO <sup>(2)</sup>	20	
Source current for all IOs		-20	

1. Power supply V<sub>CC</sub> and ground V<sub>SS</sub> pins must always be connected to the external power supply within the allowable range.
2. These I/O types refer to the terms and symbols defined by pins.

- The wake-up time is measured from the wake-up time until the first instruction is read by the user program.
- Data is based on assessment results and is not tested in production.

### 5.3.6. External clock source characteristics

#### 5.3.6.1. External high-speed clock

In bypass mode of HSE (the HSEBYP of RCC\_CR is set), when the high-speed start-up circuit in the chip stops working, the corresponding I/O is used as a standard GPIO.

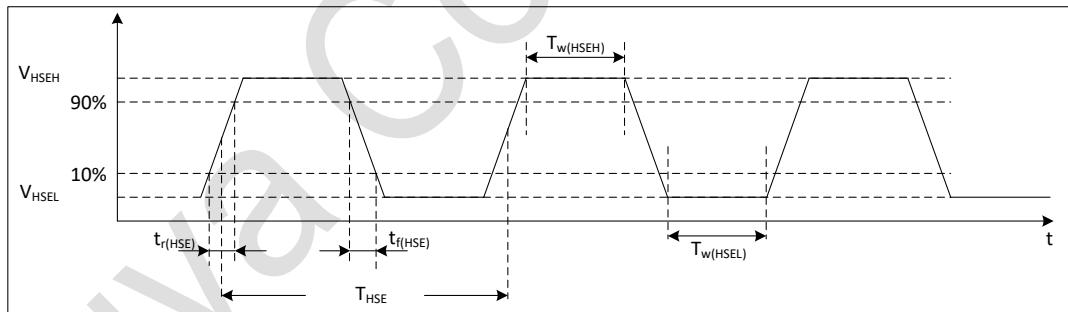

Figure 5-1 External high-speed clock timing diagram

Table 5-11 External high-speed clock features

Symbol	Parameters <sup>(1)</sup>	Minimum	Typical	Maximum	Unit
f <sub>HSE_ext</sub>	User external clock source frequency	4	8	32	MHz
V <sub>HSEH</sub>	Input pin high level voltage	0.7 V <sub>CC</sub>	-	V <sub>CC</sub>	V
V <sub>HSEL</sub>	Input pin low level voltage	V <sub>SS</sub>	-	0.3 V <sub>CC</sub>

t <sub>r</sub> (LSE) t <sub>f</sub> (LSE)	Enter the rise/fall time	-	-	50	ns

- Guaranteed by design, not tested in production.

### 5.3.6.3. External high-speed crystal

The high-speed external (HSE) clock can be supplied with a ~32 MHz crystal/ceramic resonator oscillator. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time.

Table 5-13 External high-speed crystal characteristics

Symbol	Parameter	Condition <sup>(1)</sup>	Minimum <sup>(2)</sup>	Typical	Maximum <sup>(2)</sup>	Unit
fosc_IN	Oscillation frequency	-	4	-	32	MHz
I <sub>DD</sub> <sup>(4)</sup>	HSE current consumption	During startup	-	-	5.5	mA
		V <sub>CC</sub> = 3 V, R <sub>m</sub> = 30 Ω, C <sub>L</sub> = 10 pF@8 MHz	-	0.58	-	
		V <sub>CC</sub> = 3 V, R <sub>m</sub> = 45 Ω, C <sub>L</sub> = 10 pF@8 MHz	-	0.59	-	
		V <sub>CC</sub> = 3 V, R <sub>m</sub> = 30 Ω, C <sub>L</sub> = 5 pF@48 MHz	-	0.89	-	
		V <sub>CC</sub> = 3 V, R <sub>m</sub> = 30 Ω, C <sub>L</sub> = 10 pF@48 MHz	-	1.14	-	
		V <sub>CC</sub> = 3 V, R <sub>m</sub> = 30 Ω, C <sub>L</sub> = 20 pF@48 MHz	-	1.94	-	
t <sub>su</sub> (HSE) <sup>(3)(4)</sup>	Startup Time	f <sub>osc_IN</sub> = 32 MHz	-	2	-	ms
		f <sub>osc_IN</sub> = 4 MHz	-	2	-	

- Crystal/ceramic resonator characteristics are based on the manufacturer's datasheet.

- Guaranteed by design, not tested in production.

3.  $t_{SU(HSE)}$  is the startup time from enable (by software) to when the clock oscillation reaches a stable state, measured for a standard crystal/resonator, which can vary considerably from one crystal/resonator to another .
4. Data is based on assessment results and is not tested in production.

#### 5.3.6.4. External low speed crystal

The low-speed external (LSE) clock can be supplied with a 32.768 KHz crystal resonator oscillator. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time.

Table 5-14 External low-speed crystal feature

Symbol	Parameter	Condition <sup>(1)</sup>	Minimum <sup>(2)</sup>	Typical	Maximum <sup>(2)</sup>	Unit

		LSE_DRIVER[1:0] = 11	-	1260	-	
$t_{SU(LSE)}^{(3)(4)}$	Startup Time	-	-	3	-	s

1. Crystal/ceramic resonator characteristics are based on the manufacturer's datasheet.
2. Guaranteed by design, not tested in production.
3.  $t_{SU(LSE)}$  is the startup time from enable (by software) to when the clock oscillation reaches a stable, measured for a standard crystal/resonator , which may vary greatly from crystal to resonator.
4. Data is based on assessment results and is not tested in production.

### 5.3.17. Operational amplifier characteristics

Table 5-27 Operational amplifier characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
$V_i$	Input voltage	-	0	-	$AV_{CC}$	V
$V_o$	The output voltage	-	0.1	-	$AV_{CC} - 0.2$	V
$I_o$	Output current	-	-	-	2.2	mA
$R_L$	load time	-	5K	-	-	$\Omega$
$t_{start}$	Initialization time	-	-	-	20	us
$V_{io}$	Input offset voltage	-	-	$\pm 6$	-	mV
PM	Phase margin	-	-	80	-	Deg
UGBW	Unity gain width	-	-	10	-	MHz
SR	Slew rate	-	-	8	-	V/us

### 5.3.18. Temperature sensor characteristics

Table 5-28 Temperature sensor characteristics

Symbol	Parameter	Minimum	Typical	Maximum	Unit
$T_L^{(1)}$	$V_{TS}$ linearity with temperature	-	$\pm 1$	$\pm 2$	°C
Avg_Slope <sup>(1)</sup>	Average slope	2.3	2.5	2.7	mV/°C
$V_{30}$	Voltage at 30 °C ( $\pm 5$ °C)	0.742	0.76	0.785	V
$t_{START}^{(1)}$	Start up time entering in continuous mode	-	70	120	us
$t_{s\_temp}^{(1)}$	ADC sampling time when reading the temperature	9	-	-	us

- Guaranteed by design, not tested in production.
- Data is based on assessment results and is not tested in production.

### 5.3.19. Built-in reference voltage characteristics

Table 5-29 Built-in reference voltage characteristics

Symbol	Parameter	Minimum	Typical	Maximum	Unit
$V_{REFINT}$	Internal reference voltage	1.17	1.2	1.23	V
$t_{start\_vrefint}$	Start time of internal reference voltage	-	10	15	us
$T_{coeff}$	Temperature coefficient	-	-	100 <sup>(1)</sup>	ppm/ °C
$I_{VCC}$	Current consumption from $V_{CC}$	-	12	20	uA
$T_{coeff}$	Internal 2.5 V/1.5 V temperature coefficient	$T_A = -40 \sim 105^\circ C$	-	120	ppm/ °C

- Guaranteed by design, not tested in production.

### 5.3.20. Timer characteristics

Table 5-30 Timer characteristics

Symbol	Parameter	Condition	Minimum	Maximum	Unit
$t_{res(TIM)}$	Timer resolution time	-	1	-	$t_{TIMxCLK}$

### 5.3.21. Communication port characteristics

#### 5.3.21.1. I<sup>2</sup>C bus interface features

The I<sup>2</sup>C interface meets the timing requirements of the I<sup>2</sup>C-bus specification and user manual:

- Standard-mode (Sm): 100 kbit/s
- Fast-mode (Fm): 400 kbit/s

The I<sup>2</sup>C timings requirements is guaranteed by design, provided the I<sup>2</sup>C peripheral is properly configured and the I<sup>2</sup>C CLK frequency is greater than the minimum required in the table below.

Table 5-34 Minimum I<sup>2</sup>C CLK frequency

Symbol	Parameter	Condition	Minimum	Unit
$f_{I2CCLK(min)}$	Minimum I <sup>2</sup> C CLK frequency	Standard-mode	2	MHz
		Fast-mode	9	

I<sup>2</sup>C SDA and SCL pins have analogue filtering, see table below.

Table 5-35 I<sup>2</sup>C filter characteristics

Symbol	Parameter	Minimum	Maximum	Unit
$t_{AF}$	Limiting duration of spikes suppressed by the filter (spikes shorter than the limiting duration are suppressed)	50	260	ns

#### 5.3.21.2. Serial peripheral interface (SPI) characteristics

Table 5-36 SPI characteristics

Symbol	Parameter	Condition	Minimum	Maximum	Unit
$f_{SCK}$ $1/t_{c(SCK)}$	SPI clock frequency	Master mode	-	24	MHz
		Slave mode	-	18	
$t_{r(SCK)}$ $t_{f(SCK)}$	SPI clock rise and fall time	Capacitive load: $C = 15 \text{ pF}$	-	6	ns
$t_{su(NSS)}$	NSS setup time	Slave mode	4 Tpclk	-	ns
$t_{h(NSS)}$	NSS hold time	Slave mode	2 Tpclk + 10	-	ns
$t_{w(SCKH)}$ $t_{w(SCKL)}$	SCK high and low time	Master mode, presc = 4	Tpclk*2 - 2	Tpclk*2 + 1	ns
$t_{su(MI)}$	Data input setup time	Master mode, presc = 4	Tpclk + 5 <sup>(1)</sup>	-	ns

Symbol	Parameter	Condition	Minimum	Maximum	Unit
$t_{su(SI)}$		Slave mode, presc = 4	5	-	
$t_h(MI)$	Data input hold time	Master mode	5	-	ns
$t_h(SI)$		Slave mode	$T_{pclk} + 5$	-	
$t_a(SO)$	Data output access time	Slave mode, presc = 4	0	$3T_{pclk}$	ns
$t_{dis(SO)}$	Data output disable time	Slave mode	$2T_{pclk} + 5$	$4T_{pclk} + 5$	ns
$t_v(SO)$	Data output valid time	Slave mode (after enable edge), presc = 4	0	$1.5T_{pclk}^{(2)}$	ns
$t_v(MO)$	Data output valid time	Master mode (after enable edge)	-	6	ns
$t_h(SO)$	Data output hold time	Slave mode, presc = 4	$0^{(3)}$	-	ns
$t_h(MO)$		Master mode	2	-	
DuCy(SCK)	SPI slave input clock duty cycle	Slave mode	45	55	%

1. The Master generates a 1 pclk receive control signal before the receive edge.
2. Slave has a maximum of 1 pclk based on the sending edge of SCK delay, considering IO delay, etc., define 1.5 pclk.
3. Between the receiving edge and the sending edge , the slave updates the data before the sending edge.
